Data Description

This section describes the data used to select the right area to open a hip and healthy Japanese restaurant, and how to use it.

- Foursquare API: Retrieves the location of an area and its facilities, including the location of restaurants and places of interest.
- The Python Folium package: plots this information on a map to highlight the features of each area.

Based on the characteristics of each area, determine the expected crowds and rank the areas where to open a restaurant.
